

MULTI-MODAL AI MEDICAL TRIAGE SUMMARY

Decision Support Prototype for Rural Healthcare Access | UN SDG 3

Assessment Date: 2026-10-07 09:51:06	Patient Age/Sex: 18 yrs / Male
Resting BP: 118 mmHg	Blood Glucose: 92 mg/dL

OVERALL URGENCY: MEDIUM

Calibrated Score: 55%

Clinical Synthesis: Patient is triaged as MEDIUM urgency (55%), warranting formal physician consultation within 24 to 48 hours. Primary findings show moderate symptom burden. Vital signs are stable and within normal physiological limits (Mean HR: 74 bpm, Min SpO2: 97.0%). Begin outpatient monitoring and implement targeted supportive self-care in the interim.

Multi-Modal Component Breakdown

Modality	Model Tier	Score	Clinical Findings
Risk Screening	LOW	5%	Baseline chronic risk is LOW (Score: 4.6%). Primary risk driver is Cardiovascular Disease (Heart Risk: 4.6%, Diabetes Risk: 2.5%). Max Heart Rate Achieved (160.0) were the biggest factors elevating risk. Conversely, Exercise Induced Angina (0), Serum Cholesterol (165.0) provided protective effects.
Vitals Anomaly	LOW	30%	Vital signs are stable and within normal physiological limits (Mean HR: 74 bpm, Min SpO2: 97.0%).
Symptom Triage	MEDIUM	98%	Key urgent features observed: 'persistent', 'shivering', 'with'. Timely physician assessment advised (confidence: 98%).

Actionable Care Recommendations

Action: Schedule an outpatient physician visit within 24-48 hours for clinical evaluation.

Targeted Yoga Asana / Pranayama:

- **Anulom Vilom (Alternate Nostril Breathing):** Helps modulate autonomic nervous tone, reduces sympathetic hyperactivity, and supports blood pressure stabilization.

Dietary Adjustments:

- Maintain adequate hydration (2.5 to 3 liters of clean drinking water daily).
- Aim for half your plate filled with colorful seasonal vegetables and raw salads.
- Ensure consistent meal timing and allow at least 2 hours between dinner and sleep.

Exercise Guidance: 30-40 minutes of moderate cardiovascular aerobic activity (brisk walking, cycling, or light swimming) 5 days per week plus 2 sessions of bodyweight strength maintenance.

DISCLAIMER: This multi-modal triage tool is an AI-powered clinical decision-support prototype created to assist healthcare access and prioritization in underserved and rural areas. It does NOT constitute a definitive medical diagnosis or replacement for licensed clinical consultation. In cases of acute pain or emergency, seek immediate professional care.
